INTRODUCTION / OBJECTIVES

At the present time, a legally defined specialization programme and hospital pharmacist career don’t exist. This fact is directly related to job satisfaction. Mentioning new legislation has been published regarding a new career in National Health Service in Portugal.

The aim of this study is to assess the overall job satisfaction and the nine-subscale measurement of the Job Satisfaction Survey (JSS), considering the following variables:

- Job characteristics
- Work domain, work region, management functions, employment relationship
- Private/public sector.

METHODS

We conducted a descriptive statistical study based on information collected by the JSS of Spector (1985), a nine-subscale measure of employee job satisfaction, applicable specifically to human service, public, and nonprofit sector organizations, that was adapted to Portuguese language by Malheiro (2009).

The survey contains 36 items. Four items for each subscale and a overall satisfaction score can be computed by combining all of the items. It uses a summated rating scale format (Likert) that can have a score from 1 to 6 for each item. Response choices are scored as: 1 - disagree very much, 2 - disagree moderately, 3 - disagree slightly, 4 - agree slightly, 5 - agree moderately, 6 - agree very much. The total value is translated according to table I.

The survey was made available online, using the website: https://www.survio.com/pl and distributed via e-mail, social network (Facebook and LinkedIn) and through WhatsApp, during forty-seven days (15 January to 3 March 2016).

The nine-subscale considered by Spector are: pay, promotion, supervision, benefits, contingent rewards, operating procedures, co-workers, nature of work and communication.

RESULTS

One hundred and nine hospital pharmacists participated in the survey (n = 110 of total hospital pharmacists). The overall satisfaction grade was 2.80 (slightly dissatisfied). The satisfaction of the subscales were: 1.73 (pay), 1.72 (promotion), 3.58 (supervision), 1.99 (benefits), 2.41 (contingent rewards), 2.58 (operating procedures), 3.67 (co-workers), 4.58 (nature of work) and 2.99 (communication).

</table>

Analyzing the variables, we ascertained that the most satisfied workers are: female pharmacists (2.83), that are less than 35 years old (2.91) and less than 3 years of work (3.07), work in Lisboa e Vale do Tejo (2.99), are fixed-term workers (3.52), have management functions (3.06) and work in a private sector (0.04).

On the other hand, male pharmacists (2.6), that are 35 to 44 years old (2.68) and between 3-10 years of work (2.67), who work in Central Portugal region(2.72), have open-ended contracts (2.70), don’t have management functions (2.69) and work in the public sector (3.04) are the most dissatisfied.

</tbody>
</table>

The question with best score was “I feel a sense of pride in doing my job” (5.07) and with worst score was “Raises are too few and far between” (1.31).

The Cronbach’s alpha test values were 0.87, indicating a good internal consistency of the survey and therefore the results can be considered valid.

CONCLUSIONS

The sample under study is slightly dissatisfied (2.86) with their job. The best scores are found in the questions regarding work environment, and the worst in the ones related to communication. These results indicate that dissatisfaction comes from aspects that are not controllable by professionals but only by the institutions/government.

The high level of satisfaction related with the nature of work (4.96) associated with the best score questions indicates that the sample of pharmacists in study are happy with their professional activity and feel fulfilled.

The greatest limitation of this study is the possibility that the same person could have answered the survey several times. We can assume that the risk of this limitation is minimum due to the time it takes to complete the survey.

In the future a new approach could improve this study, such as associating the level of satisfaction with other concepts (e.g. professional performance).
