SERVICIO DE FARMACIA. HOSPITAL UNIVERSITARIO DE MÓSTOLES.

BACKGROUND

The dosing optimisation consists in obtaining for each patient therapeutic benefits with the lowest possible dose, improving the patient’s adherence and reducing adverse effects.

AIM AND OBJECTIVES

To know the impact of the implantation of a tool on the electronic medical history (ECHR), of patients of Rheumatology in treatment with biologic drugs with optimisation or not

MATERIALS AND METHODS

The multidisciplinary team defined optimization strategies

The tools were incorporated as an alert in the ECHR for patients with:

- Biologic drugs (BD)
- Optimised biological drugs (OBD)

RESULTS

- At the beginning: 236 patients
- 8 months later: 279 patients
- 63 patients
- 91 patients

CONCLUSIONS

This tool has been shown to be effective in monitoring of patients in treatment with biologic drugs and it has had a high impact on optimizing these treatments
