BACKGROUND
Ranibizumab is the election treatment in retinal pathologies, what produce a negative impact on patients’ vision-related quality of life (vrQoL).

PURPOSE
To evaluate the effect of Ranibizumab in vrQoL on patients with retinal pathologies.

MATERIAL AND METHODS
Observational, prospective study approved by the local Ethics Committee.

RESULTS
Ranibizumab improved statistically significant general vision and near vision subscales but not the overall composite score during one year of treatment. The BCVA kept over the study.

CONCLUSION
Ranibizumab improved statistically significant general vision and near vision subscales but not the overall composite score during one year of treatment. The BCVA kept over the study.
